5.5 After the staging is completed, commit to the local git repository. Write the git command you use in the space provided below.

git commit -m "Initial commit for Lab2"

5.7 At your local git repository, specify the URL of the remote GitHub repository. Set up the upstream branch. After that, push the local git repository to GitHub. Write the git commands you use in the space provided below.

git remote add origin https://github.com/emeryaydan/ET0735-DevOps-AIoT.git
git push -u origin master

Write down the last error observed in Visual Studio Code console in the box below

TypeError: can only concatenate str (not "float") to str

In the box below, write down the reason why the "str()" function has helped to fix the error.

The "str()" function fixed the error by converting the float values to strings, allowing them to be concatenated with other strings. This resolved the TypeError that occured when trying to concatenate strings with floats directly.
